

Four relationships that a single “influence” edge would hide

a

Composition within an inherited framework

Retains the paired-cube circuit and conditional interfaces.
Bit admission becomes the remaining reported bottleneck.

Author statements, frozen current bodies • independent replay unknown

b

Audit with no new bound

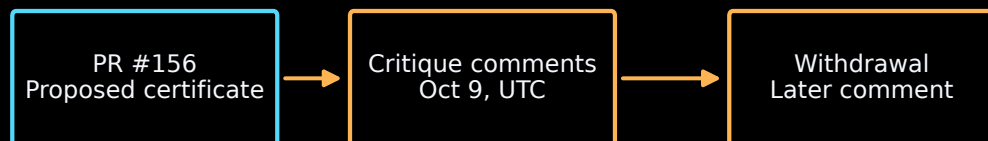

Same reported κ ; audit scope excludes global optimal packing
and an unconditional multiplication theorem.

Shorthand-only link missed by the URL graph • audit is source-reported

c

Critique and withdrawal

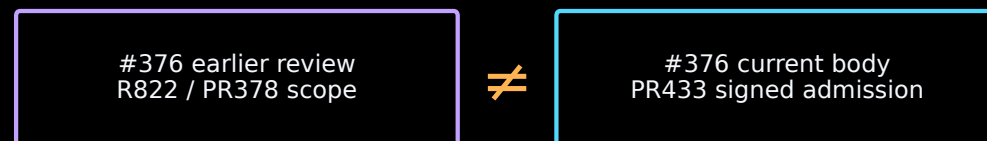

Comment events belong to the same PR, not invented new PRs.
Reported histogram / physical-plan problems remain attributed.

A withdrawn claim is retained in the record • no inference of intent

d

Earlier review $\neq$ current claim

Review precedes PR #433 opening. Current-body contribution
is different; the prior review cannot be reassigned to it.

Snapshot PR head SHA also does not version mutable body text
